RESEARCH INTERESTS

I have a broad interest in resource management for large-scale data centers. Specifically, my research focuses on: (a) improving *resource efficiency* for AI/GPU clusters; (b) building *efficient* and *low-cost* AI model serving systems.

Resource Management for AI/GPU Clusters

Mitigate GPU Resource Fragmentation

◊ **[Under review]** GPU disaggregation for recommendation services.

◊ **[ATC 2023]** Formally identified *statistical GPU resource fragments* and proposed the *fragmentation gradient descent* scheduling algorithm to reduce resource fragmentation. Our scheduling policy can significantly improve GPU allocation rate by 3% compared to state-of-the-art policies. [\[code\]](#)

◊ Developed *ParaSet*, a best-effort workload on Kubernetes that can dynamically adjust the number of instances and resource requirements based on the real-time resource availability in the cluster. It aims to fill resource fragments in the cluster and is integrated into KubeDL for internal use.

Large-Scale GPU Sharing in Production

◊ Enabled *large-scale GPU sharing* in production clusters, with over 10k shared GPU containers running on a daily basis. Support the co-location of GPU tasks with different priorities (e.g., *latency-sensitive*, *best-effort*).

◇ Specifically, I was responsible for the design and implementation of the node-level agent and the cluster-level controller. The agent periodically collects and reports resource usage metrics, as well as dynamically allocates GPU resources to different containers. The controller calculates potential resource overcommitment and provides scheduling guidance to the cluster scheduler.

Efficient and Low-cost AI Model Serving Systems

Efficient Diffusion Model Serving with Add-on Modules

◇ [**Under review**] Developed SwiftDiffusion.

Auto-Configuration for AI Serving Service

◇ [**SoCC 2021**] Developed Morphling, an open-source auto-configuration framework for AI serving on Kubernetes. It combines *meta-learning* and *bayesian optimization* to quickly find the optimal configuration. It was widely used in Alibaba for automated recommendation of container resource specifications.
